# Introduction

Title: Pig Dice Game

Pig is a dice game that is played with a 6 sided dice and is recommend at least two players to play making it more efficient, but one player is possibly . The objective of the game is to be the first one to score 100 points once you have reached 100 points you are the winner.

The Gameplay:

Player 1 rolls the dice repeatedly until the player rolls a 1 or the player chooses to hold. Rolling a 1 ends the player's turn and no points are earned. If the player chooses to hold, all points rolled during that play are then added together and becomes the score of player 1. Player 2 would then repeat the same steps above. Player 3 would then repeat the same steps above. This process would continue until a player reaches the score limit of 100 point. Meaning that that player is considered the winner of the game.

## Summary

Project size: 264 lines

The number of variables:11

The number of methods:

This project includes many of concept that we learned from Chapter 2 to Chapter 5 in our textbook Gaddis 8thEd. The interaction of the user and the program can be improved program to be more user friendly with an active GUI.

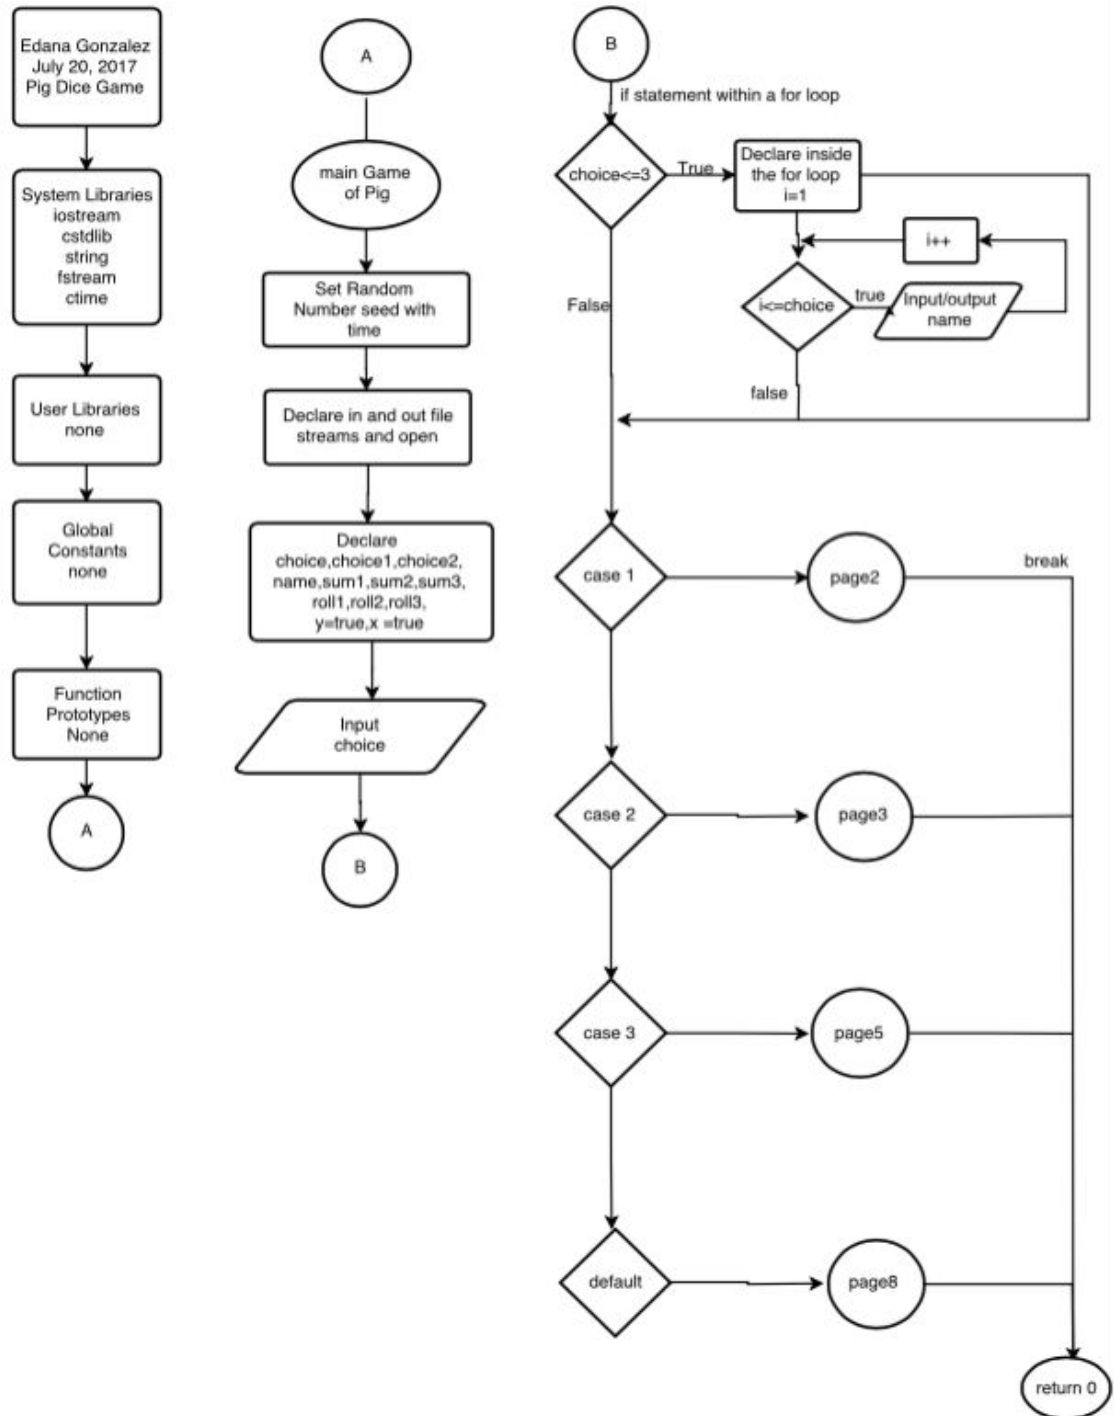

This program approximately took me about a week to complete which was the give time to complete the project. I came across many obstacles along the way, but that did not stop me from continuing. One of the main problems that I came along the way was making the project go back to the top of the code. I first got it to go from player 1 to player 2, but once player 2 turn finished the program would not go back to player 1 and would stop, but I did some research to see what was something helpful to make it work. Although my project is not the best at the moment I believe I can improve it for project 2.

## Description

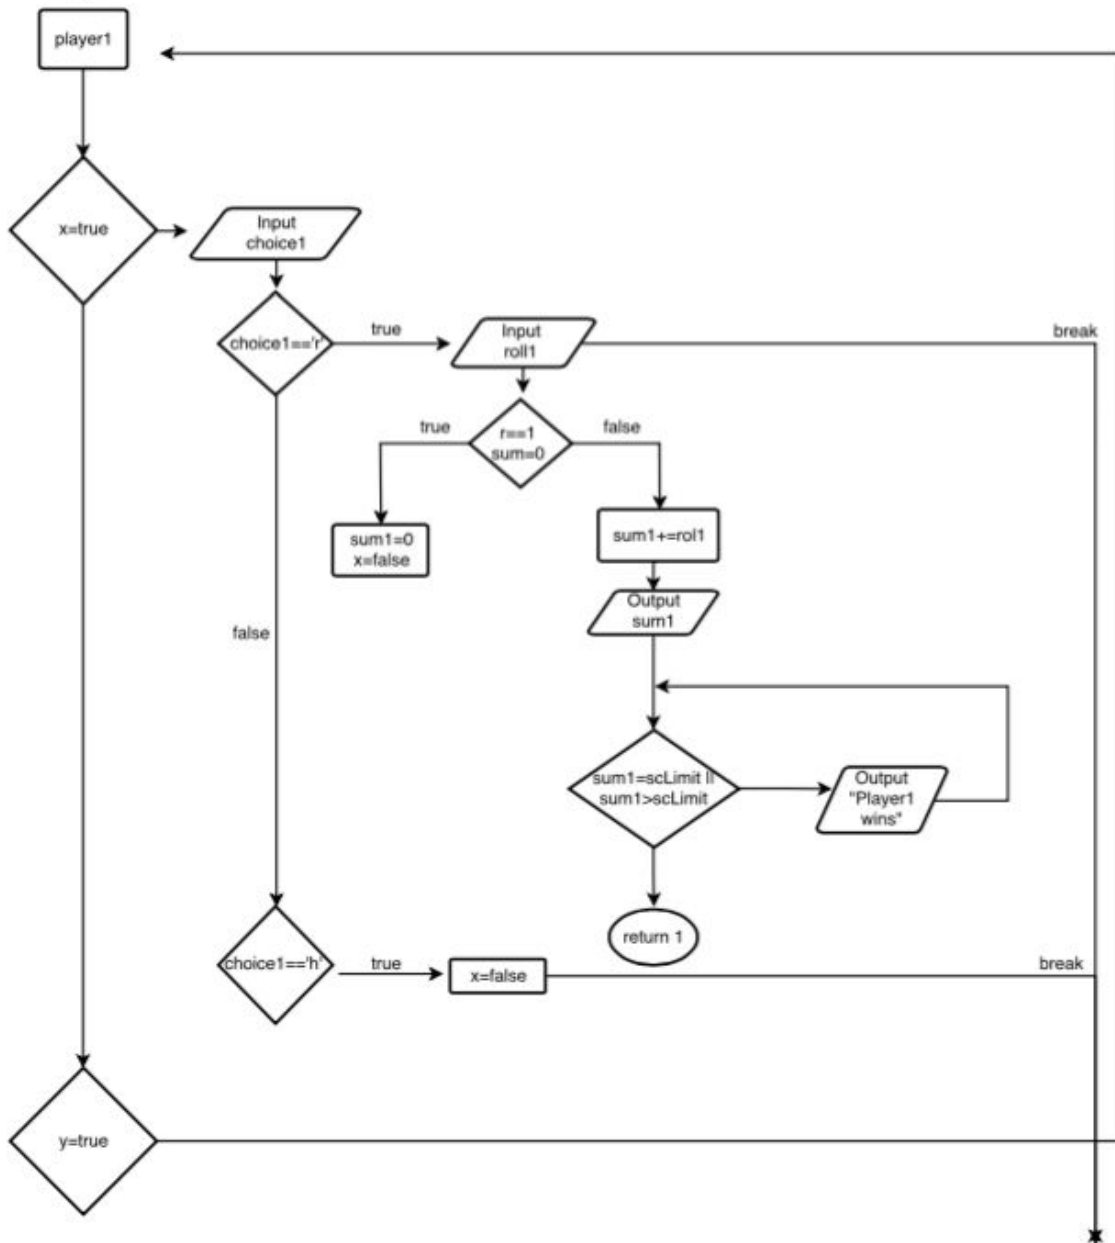

The program stats off by asking the user the amount of player and their names. Then it goes off to rolling the dice back and forth from the players involved until they finally reach the score limit of 100.

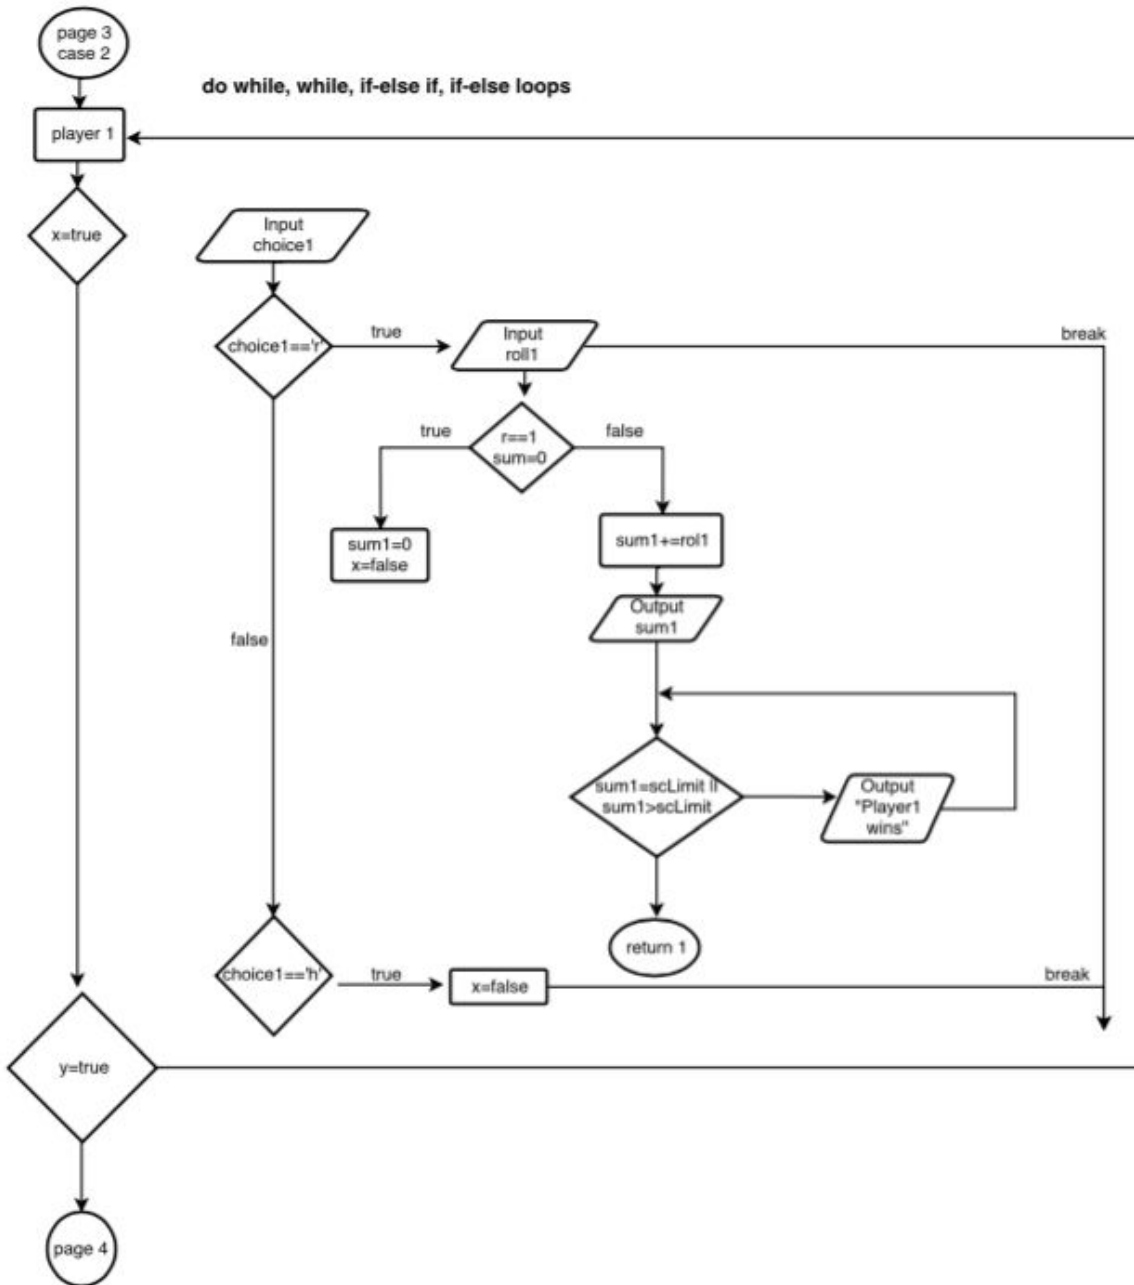

# FlowChart

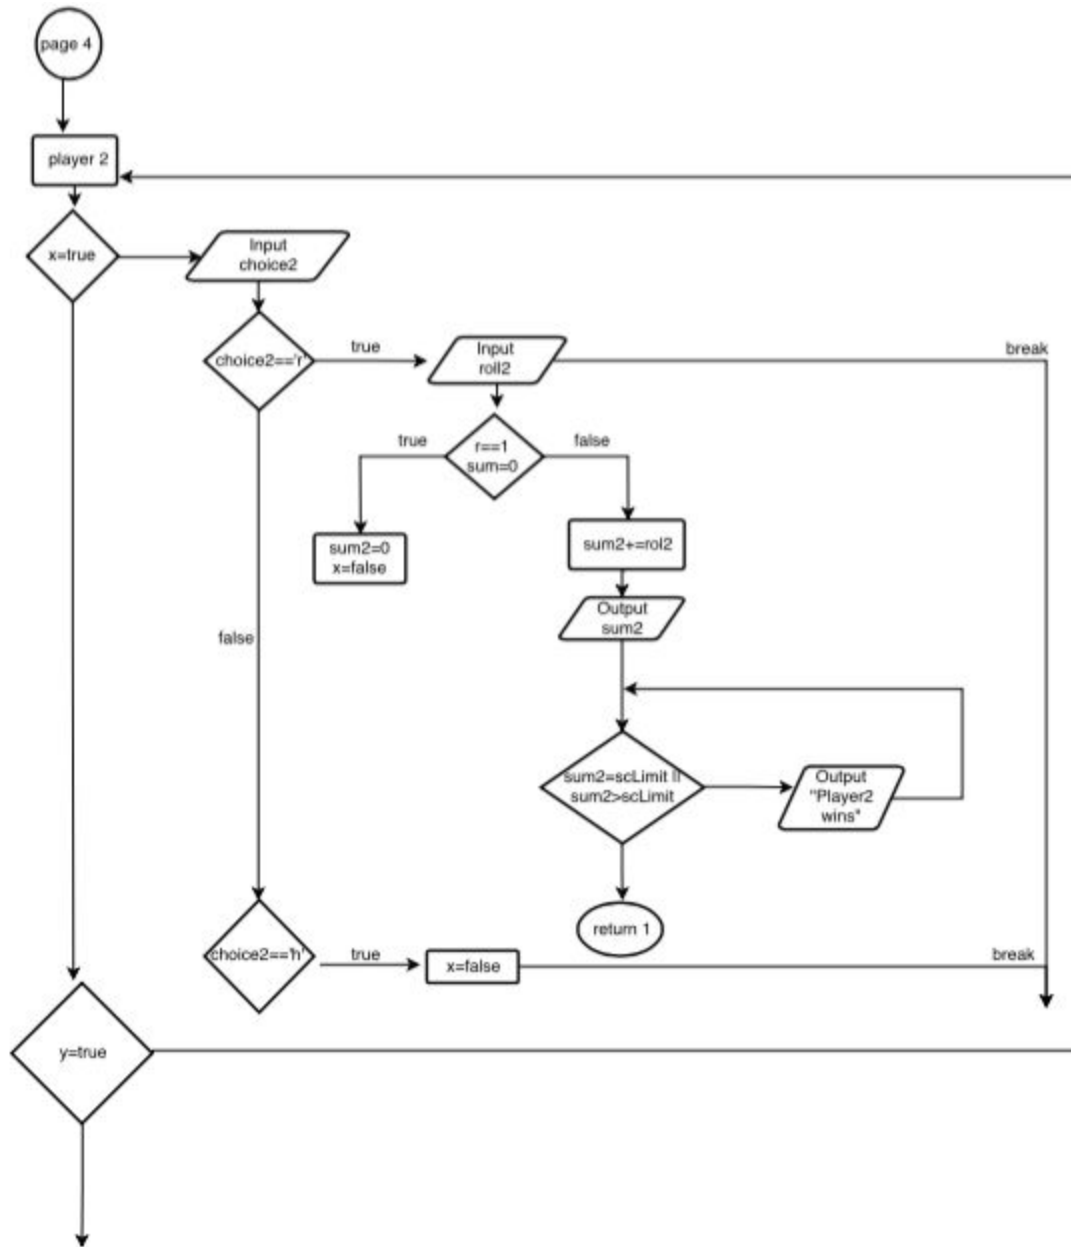

## Pig Dice Game FlowChart

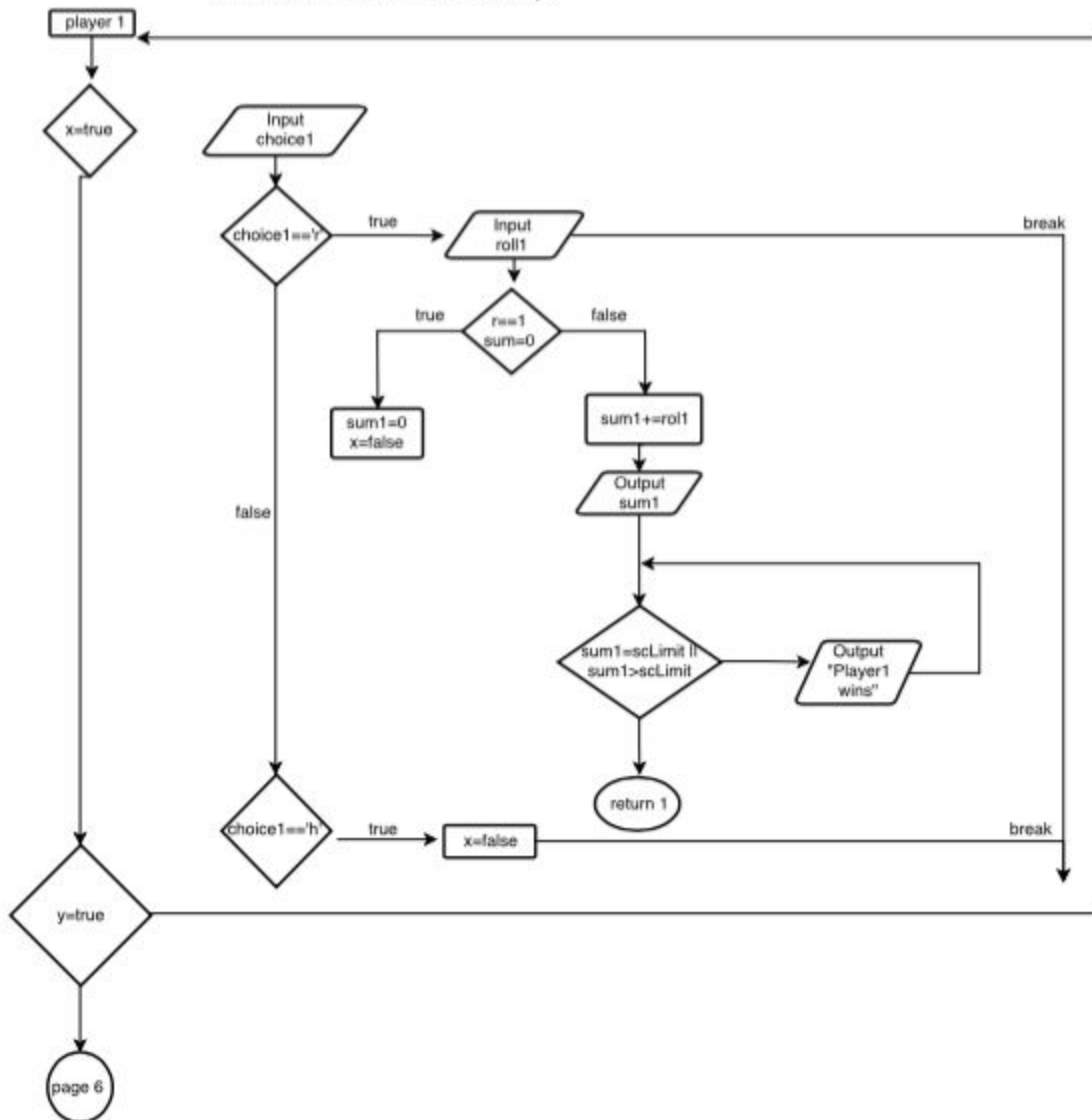

do while, while, if-else if, if-else loops

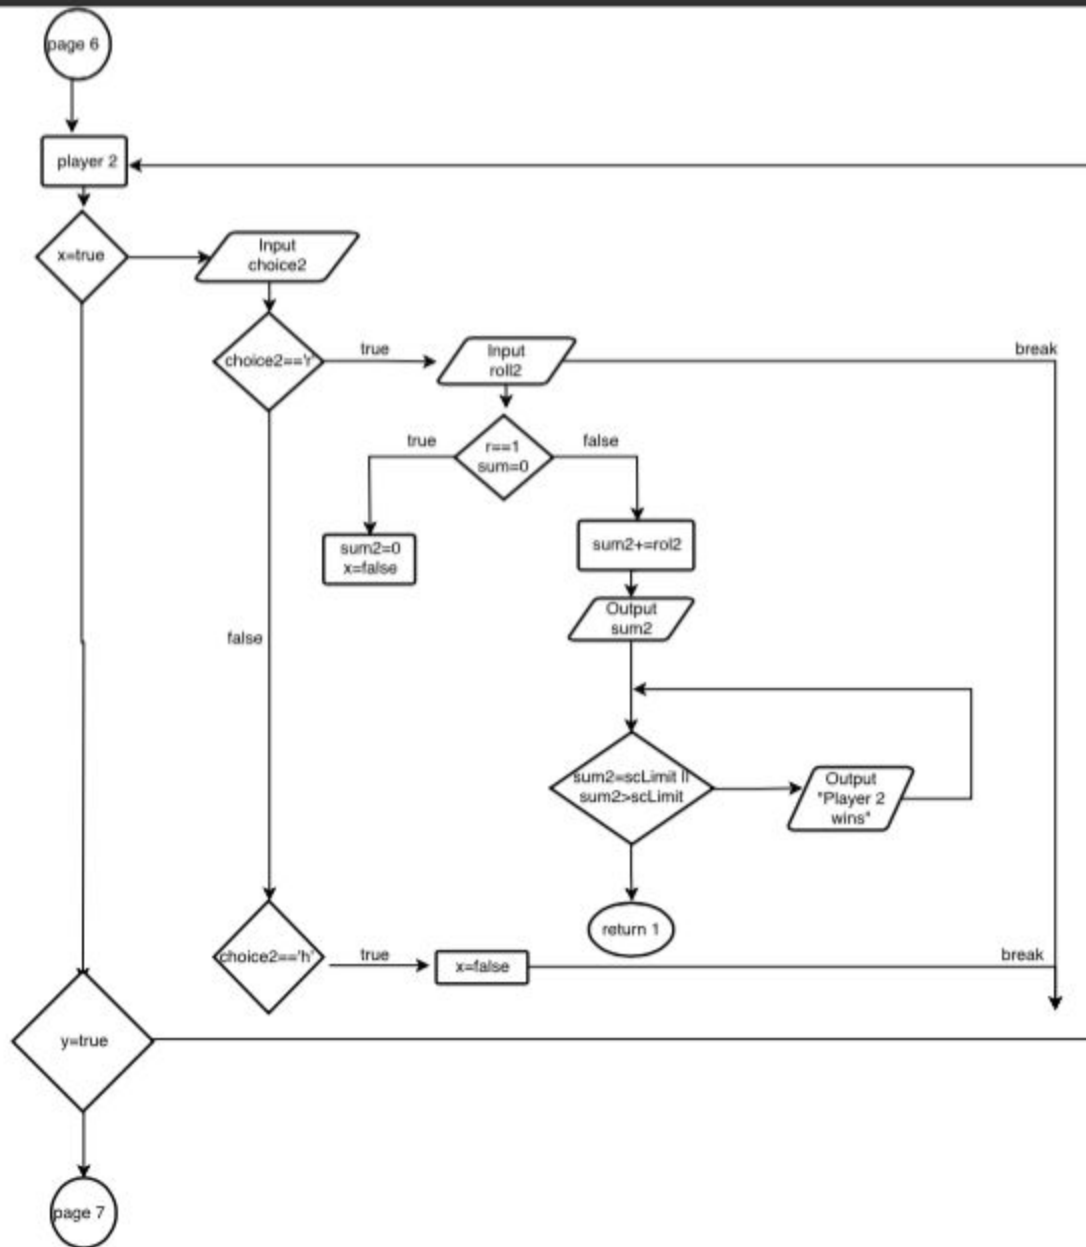

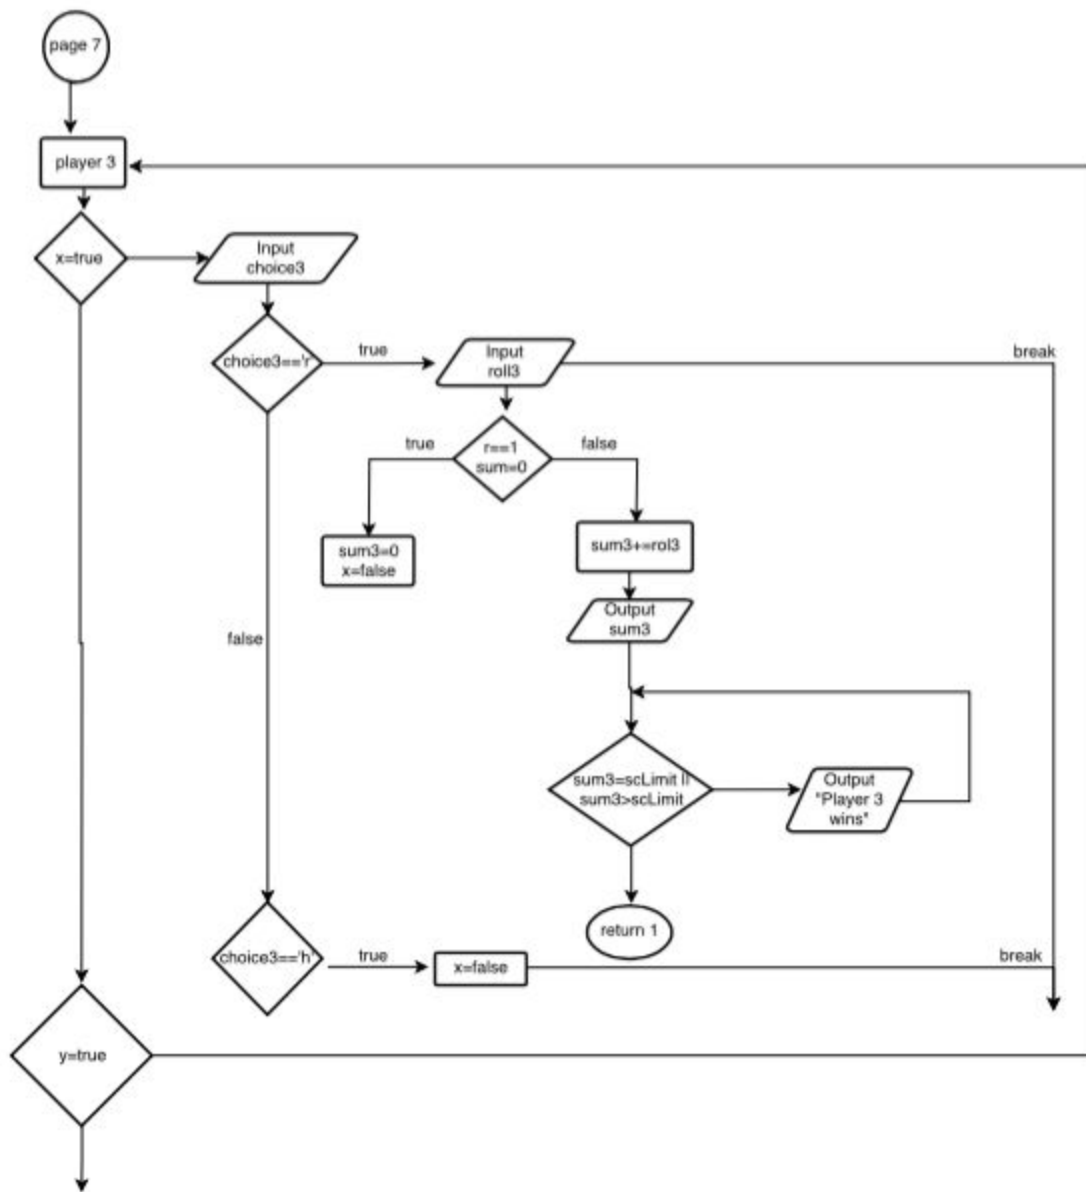

do while, while, if-else if, if-else loops

# Pseudo Code

Add the libraries for Random time, time ,file I/O,string, and etc.

Create the Random Number Generator

Declare the input and output files

Declare variables for the players ( choice ( ),sum ( ), roll( ) ),  
the string for player's name, bool

Initialize the variables for input/output files

State the objective of the game

Ask for the number of players

If the number of players are 1, 2 , or 3 ask to input their names, but if user enters any other number it ask to run the program again

The output for the number of players 1, 2, or, 3

If user enters 1 then the player will roll the dice until they reach the score limit of 100

Rolling a 1 causes player's turn to end, but otherwise continues to roll until the call hold

If user enters 2 then the players will roll the dice until they reach the score limit of 100

Rolling a 1 causes player's turn to end, but otherwise continues to roll until the call hold

Outputs who wins

If user enters 3 then the players will roll the dice until they reach the score limit of 100

Rolling a 1 causes player's turn to end, but otherwise continues to roll until the call hold

Outputs who wins
